

## BRIGHT GREEN PD 2437

### .200" 4-Character, 5 x 7 Dot Matrix Alphanumeric Programmable Display™ With Built-In CMOS Control Functions

LED Programmable/  
Intelligent  
Display Devices

#### FEATURES

- Four .200" Dot Matrix Characters in Bright Green or High-Efficiency Red
- Readable from 8 Feet (2.5 meters)
- Built-in Memory, Decoders, Multiplexer and Drivers
- Wide Viewing Angle, X Axis  $\pm 55^\circ$ , Y Axis  $\pm 65^\circ$
- Categorized for Luminous Intensity
- 96-Character ASCII Format (Both Upper and Lower Case Characters)
- 8-Bit Bidirectional Data BUS
- READ/WRITE Capability
- 100% Burned In and Tested
- Dual In-Line Package Configuration, .600" Wide, .100" Pin Centers
- End-Stackable Package
- Internal or External Clock
- Built-in Character Generator ROM
- TTL Compatible
- Easily Cascaded for Multidisplay Operation
- Less CPU Time Required
- Software Controlled Features:
  - Programmable Highlight Attribute (Blinking, Non-Blinking)
  - Asynchronous Memory Clear Function
  - Lamp Test
  - Display Blank Function
  - Single or Multiple Character Blinking Function
  - Programmable Intensity, Three Brightness Levels
- Extended Operating Temperature Range:  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$

#### DESCRIPTION

The PD 2435 and PD 2437 are four digit display system modules. The digits are 0.20" by 0.14" 5 x 7 dot matrix arrays constructed with the latest solid state technology in light emitting diodes. The diodes, having transparent substrates, are optimized for maximum light output in the visible red (630 nm) and Green (560 nm) spectrums. Driving and controlling the LED arrays are two silicon gate CMOS integrated circuits. These integrated circuits provide all necessary power transistors and complete multiplexing control logic to efficiently strobe the LEDs for maximum perceived brightness with minimum power utilization.

Additionally, the ICs have the necessary ROM to decode 96 ASCII alphanumeric characters and enough RAM to store the display's complete four digit ASCII message with special attributes. These attributes, all software programmable at the user's discretion, include a lamp test, brightness control, displaying cursors, alternating cursors and characters, and flashing cursors or characters. The CMOS ICs also incorporate special interface control circuitry to allow the user to control the module as a fully supported microprocessor peripheral. The module, under internal or external clock control, has asynchronous read, write, and memory clear over an eight bit parallel, TTL compatible, bi-directional data bus. Each X and Y stackable module is fully encapsulated within a package 1.0" x 0.7" x 0.2". The standard 20 pin DIP construction with two 0.6" rows on 0.1" centers is wave solderable and has been fully tested with over one million total device hours to operate over a temperature range from  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ . All of the devices are 100% burned in and tested prior to shipment. Final outgoing A.Q.L. inspection is maintained at 1.0% for mechanical and dimensional specifications, optical defects, lead solderability and package integrity. Local defects on die, brightness matching

Specifications are subject to change without notice.

**DESCRIPTION (Continued)**

LED to LED, digit to digit, device to device; catastrophic electrical parameters are held to 0.25% A.Q.L. All the devices are intensity binned to allow users to construct a uniform display of any length.<sup>(1)</sup>

Note: 1. Refer to the end of this data sheet or to Appnotes 18, 19, 22, and 23 for further details on handling and assembling Siemens Programmable Displays.

**Maximum Ratings**

DC Supply Voltage . . . . . -0.5 to +6.0 Vdc  
 Input Voltage Levels Relative to GND (all inputs) . . . . . -0.5 to V<sub>CC</sub> +0.5 Vdc  
 Operating Temperature . . . . . -40°C to +85°C  
 Storage Temperature . . . . . -40°C to +100°C  
 Maximum Solder Temperature .063" (1.59 mm) below Seating Plan, t < 5 sec . . . . . 260°C  
 Relative Humidity @85°C . . . . . 85%

**Optical Characteristics @25°C**

Spectral Peak Wavelength . . . . . (2435) 630 nm typ.  
 . . . . . (2437) 560 nm typ.  
 Display Multiplex Rate . . . . . 200 to 300 Hz  
 Viewing Angle  
 horizontal . . . . . ± 55°  
 (off normal axis) vertical . . . . . ± 65°  
 Digit Height . . . . . 0.200 inch (5.08 mm)  
 Time Averaged Luminous Intensity<sup>(1)</sup>  
 (100% brightness, 5 Vdc=V<sub>CC</sub>) . . . . . 200 μcd/LED typ.  
 HER . . . . . 75 μcd/LED min.  
 Green . . . . . 100 μcd/LED min.  
 LED to LED Intensity Matching . . . . . 1.8:1.0 max.  
 Device to Device (one bin) . . . . . 1.5:1.0 max.  
 Bin to Bin (adjacent bin) . . . . . 1.9:1.0 max.

Note: 1. Peak luminous intensity values can be calculated by multiplying these values by 7.

**SWITCHING SPECIFICATIONS**

(@25°C and V<sub>CC</sub> = 4.5V)<sup>(1)</sup>

READ CYCLE TIMING		
Parameter	Description	Spec. (ns) Minimum
TAD	Address set up delay after CE	0
TACC	Access time for data valid after address	175 max.
TDD	Delay time for data valid after read pulse	150 max.
TRC	Total read cycle time	200
TDH	Data valid after end of read pulse	0
TRD	Read pulse	175

WRITE CYCLE TIMING		
Parameter	Description	Spec. (ns) Minimum
TWD	Delay time for write pulse after control signals and data	50
TDH	Data hold after write pulse	50
TWC	Total write cycle time	200
TWR	Write pulse width	100

Note: 1. Timing characteristics are guaranteed values at the worst case condition of V<sub>CC</sub> = 4.5 Vdc. Characterization data indicates these values also hold over temperature from -40°C to +85°C except for TAD and TDH. These two timing minimums may extend to 5 ns at +70°C and above.

**TIMING MEASUREMENT LEVELS**

**TIMING CHARACTERISTICS AT 25°C**  
V<sub>CC</sub> = 4.5V

**DATA "READ" CYCLE**

**DATA "WRITE" CYCLE**

Note:  $T_{WR} = T_{WC} - (T_{WD} + T_{DH})$   
 $T_{RD} = T_{RC} - T_{AD} - (T_{ACC} - T_{DD})$

### DC CHARACTERISTICS @25°C

Parameters	Limits			Units	Conditions
	Min.	Typ.	Max.		
V <sub>CC</sub>	4.5	5.0	5.5	Volts	Nominal
I <sub>CC</sub> Blank (All Inputs Low)		2.5	5	mA	V <sub>CC</sub> = 5 V, V <sub>IN</sub> = 0.8 V, WR = 5 V
I <sub>CC</sub> Lamp Test (1/2 Brightness)		42		mA	
I <sub>CC</sub> 80 LEDs/unit (100% Bright)	125	140 <sup>(1)</sup>	155 <sup>(2)</sup>	mA	V <sub>CC</sub> = 5 V
V <sub>IL</sub> (All Inputs)	-0.5		0.8	Volts	V <sub>CC</sub> = 4.5 V to 5.5 V
V <sub>IH</sub> (All Inputs)	2.0			Volts	V <sub>CC</sub> = 4.5 V to 5.5 V
I <sub>IL</sub> (All Inputs)			100	μA	V <sub>CC</sub> = 5 V, V <sub>IN</sub> = 0.8 V

Notes: 1. Typical average LED drive current is 1.7 mA. Peak current at 1/7 multiplex rate is 12 mA.  
 2. Characterization data indicates max I<sub>CC</sub> will vary from 190 mA at -20°C to 130 mA at 70°C.

### TOP VIEW

### PIN ASSIGNMENTS

PD 2435, PD 2437 PINOUT			
Pin	Function	Pin	Function
1	RD	11	WR
2	CLK I/O	12	D7
3	CLKSEL	13	D6
4	RST	14	D5
5	CE1	15	D4
6	CE0	16	D3
7	A2	17	D2
8	A1	18	D1
9	A0	19	D0
10	GND	20	V <sub>CC</sub>

### PIN DEFINITIONS

- Pin
- RD**: Active low, will enable a processor to read all registers in the PD 2435 (PD 2437).
  - CLK I/O**: If CLK SEL (pin 3) is low, then expect an external clock source into this pin. If CLK SEL is high, then this pin will be the master or source for all other devices which have CLK SEL low.
  - CLK SEL**: CLock SElect, determines the action of pin 2. CLK I/O, see the section on Cascading for an example.
  - RST**: Reset. Must be held low until V<sub>CC</sub> > 4.5 volts. Reset is used only to synchronize blinking, and will not clear the display.
  - CE1**: Chip enable (active high).
  - CE0**: Chip enable (active low).
  - A2**: Address input (MSB).
  - A1**: Address input.
  - A0**: Address input (LSB).
  - GND**: Ground.
  - WR**: Write. Active Low. If the device is selected, a low on the write input loads the data into the PD 2435s (PD 2437s) memory.
  - D7**: Data Bus bit 7 (MSB).
  - D6**: Data Bus bit 6.
  - D5**: Data Bus bit 5.
  - D4**: Data Bus bit 4.
  - D3**: Data Bus bit 3.
  - D2**: Data Bus bit 2.
  - D1**: Data Bus bit 1.
  - D0**: Data Bus bit 0 (LSB).
  - V<sub>CC</sub>**: Plus 5 volts power pin.

**Attributes (D2-D4):** Bits D2, D3, and D4 control the visual attributes (i.e., blinking) of those display digits which have been written with bit D7 set high. In order to use any of the four attributes, the Cursor Enable bit (D4 in the Control Word) must be set. When the Cursor Enable bit is set, and bit D7 in a character location is set, the character will take on one of the following display attributes.

D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	0	0	X	X	B	B	Disable highlight attribute
0	0	0	1	0	0	B	B	Display cursor* instead of character
0	0	0	1	0	1	B	B	Blink single character
0	0	0	1	1	0	B	B	Display blinking cursor* instead of character
0	0	0	1	1	1	B	B	Alternate character with cursor*

\*"Cursor" refers to a condition when all dots in a single character space are lit to half brightness.  
 X = don't care  
 B = depends on the selected brightness

Attributes are non-destructive. If a character with bit D7 set is replaced by a cursor (Control Word bit D4 is set, and D3=D2=0) the character will remain in memory and can be revealed again by clearing D4 in the Control Word.

**Blink (D5):** The entire display can be caused to blink at a rate of approximately 2Hz by setting bit D5 in the Control Word. This blinking is independent of the state of D7 in all character locations.

In order to synchronize the blink rate in a bank of these devices, it is necessary to tie all devices' clocks and resets together as described in a later section of this data sheet.

D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	1	X	X	X	B	B	Blinking display

**Lamp Test (D6):** When the Lamp Test bit is set, all dots in the entire display are lit at half brightness. When this bit is cleared, the display returns to the characters that were

showing before the lamp test. The lamp test will remain if implemented simultaneously with a clear instruction.

D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	1	0	X	X	X	X	X	Lamp test

**Clear Data (D7):** When D7 is set in the Control Word, all character and Control Word memory bits are reset to zero. This causes total erasure of the display, and returns all digits to a non-blink, full brightness, non-cursor status.

D7	D6	D5	D4	D3	D2	D1	D0	Operation
1	0	X	X	X	X	X	X	Clear

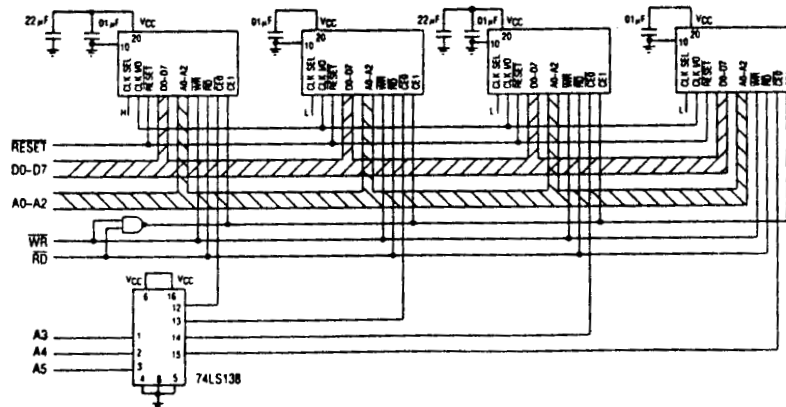

### DATA PROTOCOL

The display module continuously executes all control words programmed in the registers. Randomly, before new control words are completely defined, valid unintentional transient control words may be executed. This may present a problem if the memory clear instruction is one of the transients. To avoid the inadvertent clearing of display memory, it is suggested that display data be loaded after changes in control word programming. Alternatively, D7 must be stable in the low state throughout the complete write cycle.

### CASCADING

Cascading the PD 2435 (PD 2437) is a simple operation. The requirements for cascading are: 1) decoding the correct address to determine the chip select for each additional device, 2) assuring that all devices are reset simultaneously, and 3) selecting one display as the clock source and setting all others to accept clock input (the reason for cascading the clock is to synchronize the flashing of multiple displays). One display as a source is capable of driving six other PD 2435s (PD 2437s). If more displays are required, a buffer will be necessary. The source display must have pin 3 tied high to output clock signals. All other displays must have pin 3 tied low. External clock frequencies should not exceed 100 KHz, normally it should be 30 KHz.

### CASCADING THE PD 2435 (PD 2437)

### VOLTAGE TRANSIENT SUPPRESSION

It has become common practice to provide 0.01  $\mu$ F bypass capacitors liberally in digital systems. Like other CMOS circuitry, the Intelligent Display controller chip has very low power consumption and the usual 0.01  $\mu$ F would be adequate were it not for the LEDs. The module itself can, in some conditions, use up to 100 mA. In order to prevent power supply transients, capacitors with low inductance and high capacitance at high frequencies are required. This suggests a solid tantalum or ceramic disc for high frequency bypass. For multiple display module systems, distribute the bypass capacitors evenly, keeping capacitors as close to the power pins as possible. Use a 0.01  $\mu$ F capacitor for each display module and a 22  $\mu$ F for every third display module.

### HOW TO LOAD INFORMATION INTO THE PD 2435 (PD 2437)

Information loaded into the PD 2435 can be either ASCII data or Control Word data. The following procedure (see also typical loading sequence) will demonstrate a typical loading sequence and the resulting visual display. The word STOP is used in all of the following examples.

- Step 1** **SET BRIGHTNESS**  
Set the brightness level of the entire display to your preference (example: 100%)
- Step 2** **LOAD FOUR CHARACTERS**  
Load an "S" in the left-hand digit.
- Step 3** Load a "T" in the next digit.
- Step 4** Load an "O" in the next digit.

- Step 5** Load a "P" in the right-hand digit.  
If you loaded the information correctly, the PD-2435 should now show the word "STOP."
- Step 6** **BLINK A SINGLE CHARACTER**  
Into the digit, second from the right, load the hex code "CF," which is the code for an "O" with the D7 bit added as a control bit.  
NOTE: the "O" is the only digit which has the control bit (D7) added to normal ASCII data.
- Step 7** Load enable blinking character into the control word register.  
The PD 2435 should now display "STOP" with a flashing "O."
- Step 8** **ADD ANOTHER BLINKING CHARACTER**  
Into the left hand digit, load the hex code "D3" which is for an "S" with the D7 bit added as a control bit.  
The PD 2435 should display "STOP" with a flashing "O" and a flashing "S."
- Step 9** **ALTERNATE CHARACTER/CURSOR ENABLE**  
Load enable alternate character/cursor into the control word register.  
The PD 2435 should now display "STOP" with the "O" and the "S" alternating between the letter and a cursor (which is all dots lit).
- Step 10** **INITIATE FOUR-CHARACTER BLINKING** (Regardless of Control Bit setting)  
Load enable display blinking.  
The PD 2435 should now display the entire word "STOP" blinking.

### TYPICAL LOADING SEQUENCE

	CE0	CE1	RD	WR	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	DISPLAY

X	X	1	1	No Change

NOTE: 0 = Low Logic Level, 1 = High Logic Level, X = Don't Care

#### BLOCK DIAGRAM

#### FUNCTIONAL DESCRIPTION

The PD 2435 (PD 2437) block diagram includes the major blocks and internal registers.

**Display Memory** consists of a 5x8 bit RAM block. Each of the four 8-bit words holds the 7-bit ASCII data (bits D0-D6). The fifth 8-bit memory word is used as a control word register. A detailed description of the control register and its functions can be found under the heading Control Word. Each 8-bit word is addressable and can be read from or written to.

The **Control Logic** dictates all of the features of the display device and is discussed in the Control Word section of this data sheet.

The **Character Generator** converts the 7-bit ASCII data into the proper dot pattern for the 96 characters shown in the character set chart.

The **Clock Source** can originate either from the internal oscillator clock or from an external source—usually from the output of another PD 2435 (PD 2437) in a multiple module display.

The **Display Multiplexer** controls all display output to the digit drivers so no additional logic is required for a display system.

The **Column Drivers** are connected directly to the display.

The **Display** has four digits. Each of the four digits is comprised of 35 LEDs in a 5x7 dot array which makes up the alphanumeric characters.

The intensity of the display can be varied by the Control Word in steps of 0% (Blank), 25%, 50%, and full brightness.

#### MICROPROCESSOR INTERFACE

The interface to the microprocessor is through the address lines (A0-A2), the data bus (D0-D7), two chip select lines (CE0, CE1), and read (RD) and write (WR) lines.

To derive the appropriate enable signal, the  $\overline{WR}$  and  $\overline{RD}$  lines should be "NANDED" into the CE1 input. The CE0 should be held low when executing a read, or write operation.

The read and write lines are both active low. During a valid read the data input lines (D0-D7) become outputs. A valid write will enable the data as input lines.

#### INPUT BUFFERING

If a cable length of 18 inches or more is used, all inputs to the display should be buffered with a tri-state non-inverting buffer mounted as close to the display as conveniently possible. Recommended buffers are: 74HCT245 for the data lines and 74HCT244 or 74HC541 for the control lines.

### PROGRAMMING THE PD 2435

There are five registers within the PD 2435/2437. Four of these registers are used to hold the ASCII code of the four display characters. The fifth register is the Control Word, which is used to blink, blank, clear or dim the entire display, or to change the presentation (attributes) of individual characters.

#### ADDRESSING

The addresses within the display device are shown below. Digit 0 is the rightmost digit of the display, while digit 3 is on the left. Although there is only one Control Word, it is duplicated at the four address locations 0-3. Data can be read from any of these locations. When one of these locations is written to, all of them will change together.

Address	Contents
0	Control Word
1	Control Word (Duplicate)
2	Control Word (Duplicate)
3	Control Word (Duplicate)
4	Digit 0 (rightmost)
5	Digit 1
6	Digit 2
7	Digit 3 (leftmost)

Bit D7 of any of the display digit locations is used to allow an attribute to be assigned to that digit. The attributes are discussed in the next section. If bit D7 is set to a one, that character will be displayed using the attribute. If bit D7 is cleared, the character will display normally.

#### CONTROL WORD

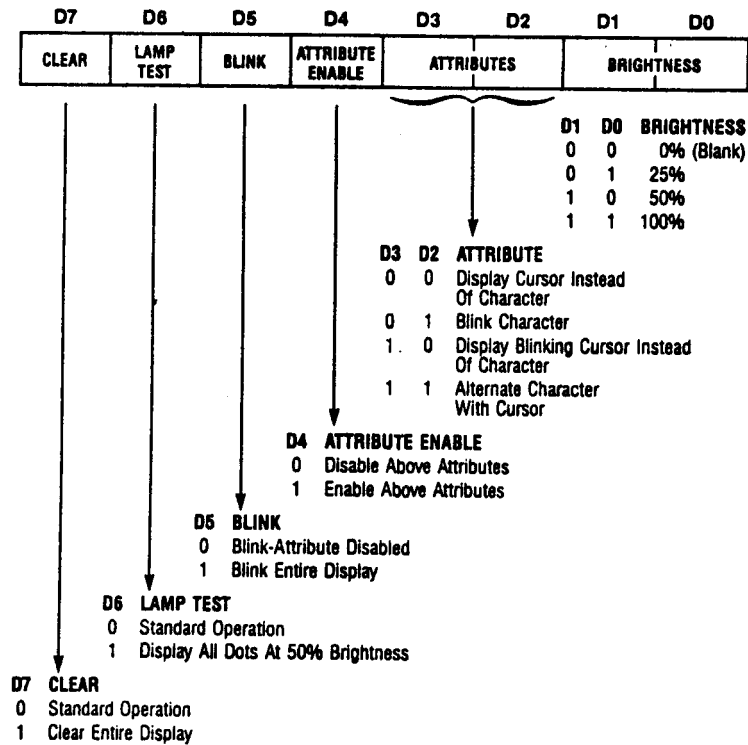

When address bit A2 is taken low, the Control Word is accessed. The same Control Word appears in all four of the lower address spaces of the display. Through the Control Word, the display can be cleared, the lamps can be tested, display brightness can be selected, and attributes can be set for any characters which have been loaded with their most significant bit (D7) set high.

**Brightness (D0, D1):** The state of the lower two bits of the Control Word are used to set the brightness of the entire display, from 0% to 100%. The table below shows the correspondence of these bits to the brightness.

D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	X	X	X	X	0	0	Blank
0	0	X	X	X	X	0	1	25% brightness
0	0	X	X	X	X	1	0	50% brightness
0	0	X	X	X	X	1	1	Full brightness

X = don't care

#### CONTROL WORD FORMAT

### CHARACTER SET

D0	L	H	L	H	L	H	L	H	L	H	L	H	L	H						
D1	L	L	H	H	L	L	H	H	L	L	H	H	L	L	H	H				
D2	L	L	L	L	H	H	H	H	L	L	L	L	H	H	H	H				
D3	L	L	L	L	L	L	L	L	H	H	H	H	H	H	H	H				
DDDD4	HEX	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F			
L	L	L	L	0	THESE CODES DISPLAY BLANK															
L	L	H	H	1																
L	H	L	L	2	!	"	#	\$	%	&	'	(	)	*	+	,	-	.	/	
L	H	H	H	3	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
H	L	L	L	4	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	
H	L	H	H	5	p	q	r	s	t	u	v	w	x	y	z	[	\	]	^	_
H	H	L	L	6	"	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
H	H	H	H	7	"	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o

- Notes: 1. A2 must be held high for ASCII data.  
 2. Bit D7 = 1 enables attributes for the assigned digit.  
 3. A cursor is defined as all dots/digit lit. When an ASCII character is in memory, an enabled cursor will "highlight" that character with slightly brighter LEDs.

### ELECTRICAL AND MECHANICAL CONSIDERATIONS

The CMOS IC of the PD 2435 and PD 2437 is designed to provide resistance to both Electrostatic Discharge Damage and Latch Up due to voltage or current surges. Several precautions are strongly recommended for the user, to avoid overstressing these built-in safeguards.

#### ESD PROTECTION

Users of the PD 2435 and PD 2437 should be careful to handle the devices consistent with Standard ESD protection procedures. Operators should wear appropriate wrist, ankle or feet ground straps and avoid clothing that collects static charges. Work surfaces, tools and transport carriers that come into contact with unshielded devices or assemblies should also be appropriately grounded.

#### LATCH UP PROTECTION

Latch up is a condition that occurs in CMOS ICs after the input protection diodes have been broken down. These diodes can be reversed through several means:

$V_{IN} < GND$ ,  $V_{IN} > V_{CC} + 0.5 V$ , or through excessive currents begin forced on the inputs. When these situations exist, the IC may develop the response of an SCR and begin conducting as much as one amp through the  $V_{CC}$  pin. This destructive condition will persist (latched) until device failure or the device is turned off.

The Voltage Transient Suppression Techniques and buffer interfaces for longer cable runs help considerably to prevent latch conditions from occurring. Additionally, the following Power Up and Power Down sequence should be observed.

#### POWER UP SEQUENCE

1. Float all active signals by tri-stating the inputs to the displays.
2. Apply  $V_{CC}$  and GND to the display.
3. Apply active signals to the displays by enabling all input signals per application.

#### POWER DOWN SEQUENCE

1. Float all active signals by tri-stating the inputs to the display.
2. Turn off the power to the display.

#### SOLDERING CONSIDERATIONS

PD 2435s and PD 2437s can be hand soldered with SN63 solder using a grounded iron set to 260°C.

Wave soldering is also possible following these conditions: Preheat that does not exceed 93°C on the solder side of the PC board or a package surface temperature of 85°C. Water soluble organic acid flux (except Carboxylic acid) or resin-based RMA flux without alcohol can be used.

Wave temperature of 245°C  $\pm$  5°C with a dwell between 1.5 sec. to 3.0 sec. Exposure to the wave should not exceed temperatures above 260°C, for 5 seconds at 0.063" below the seating plane. The packages should not be immersed in the wave.

### POST SOLDER CLEANING PROCEDURES

The least offensive cleaning solution is hot D.I. water (60°C) for less than 15 minutes. Addition of mild saponifiers is acceptable. Do not use commercial dishwasher detergents.

For faster cleaning, solvents may be used. Care should be exercised in choosing these as some may chemically attack the nylon package. Maximum exposure should not exceed two minutes at elevated temperatures. Acceptable solvents are TF (trichlorotrifluoroethane), TA, 111 Trichloroethane, and unheated acetone.<sup>(1)</sup>

Note: 1. Acceptable commercial solvents are: Basic TF, Arkclone P, Genesolv D, Genesolv DA, Blaco-Tron TF, Blaco-Tron TA and, Freon TA.

Unacceptable solvents contain alcohol, methanol, methylene chloride, ethanol, TP35, TCM, TMC, TMS+, TE, or TES. Since many commercial mixtures exist, you should contact your preferred solvent vendor for chemical composition information. Some major solvent manufacturers are: Allied Chemical Corporation, Specialty Chemical Division, Morristown, NJ; Baron-Blakeslee, Chicago, IL; Dow Chemical, Midland, MI; E.I. DuPont de Nemours & Co., Wilmington, DE.

For further information refer to Appnotes 18 and 19 in the current Siemens Optoelectronic Data Book.

An alternative to soldering and cleaning the display modules is to use sockets. Naturally, 20 pin DIP sockets .600" wide with .100" centers work well for single displays. Multiple display assemblies are best handled by longer SIP sockets or DIP sockets when available for uniform package alignment. Socket manufacturers are Aries Electronics, Inc., Frenchtown, NJ; Garry Manufacturing, New Brunswick, NJ; Robinson-Nugent, New Albany, IN; and Samtec Electronic Hardware, New Albany, IN.

For further information refer to Appnote 22 in the current Siemens Optoelectronic Data Book.

### OPTICAL CONSIDERATIONS

The .200" high character of the PD 2435 and PD 2437 allow readability up to eight feet. Proper filter selection will allow the user to build a display that can be utilized over this distance.

Filters allow the user to enhance the contrast ratio between a lit LED and the character background. This will maximize

discrimination of different characters as perceived by the display user. The only limitation is cost. The cost/benefit ratio for filters can be maximized to the user's benefit by first considering the ambient lighting environment.

Incandescent (with almost no green) or fluorescent (with almost no red) lights do not have the flat spectral response of sunlight. Plastic band-pass filters are inexpensive and effective in optimizing contrast ratios. The PD 2435 is a high efficiency red display and should be matched with a long wavelength pass filter in the 570 nm to 590 nm range. The PD 2437 should be matched with a yellow-green band-pass filter that peaks at 565 nm. For displays of multiple colors, neutral density grey filters offer the best compromise.

Additional contrast enhancement can be gained through shading the displays. Plastic band-pass filters with built-in louvers offer the "next step up" in contrast improvement. Plastic filters can be further improved with anti-reflective coatings to reduce glare. The trade-off is "fuzzy" characters. Mounting the filters close to the display reduces this effect. Care should be taken not to overheat the plastic filters by allowing for proper air flow.

Optimal filter enhancements for any condition can be gained through the use of circular polarized, anti-reflective, band-pass filters. The circular polarizing further enhances contrast by reducing the light that travels through the filter and reflects back off the display to less than 1%. Proper intensity selection of the displays will allow 10,000 foot candle sunlight visibility.

Several filter manufacturers supply quality filter materials. Some of them are: Panelgraphic Corporation, W. Caldwell, NJ; SGL Homelite, Wilmington, DE; 3M Company, Visual Products Division, St. Paul, MN; Polaroid Corporation, Polarizer Division, Cambridge, MA; Marks Polarized Corporation, Deer Park, NY; Hoya Optics, Inc., Fremont, CA.

One last note on mounting filters: recessing display and bezel assemblies is an inexpensive way to provide a shading effect in overhead lighting situations. Several Bezel manufacturers are: R.M.F. Products, Batavia, IL; Nobex Components, Griffith Plastic Corp., Burlingame, CA; Photo Chemical Products of California, Santa Monica, CA; I.E.E.-Atlas, Van Nuys, CA.
